

Guide tube for a flexible pipe for transporting hydrocarbons

The invention relates to guide tube for a flexible pipe  
5 for transporting hydrocarbons comprising an internal  
tubular element (10) consisting of a substantially  
rectilinear section (12) extending along an axis (A)  
and prolonged by a free section (14) provided with a  
curvature and a wall (38) which is internal with  
10 respect to said curvature against which said flexible  
pipe is accommodated when frictionally carried through  
said guide type. The rectilinear section (12) comprises  
eccentric guide means (18) for directing said flexible  
pipe away from the axis (A) in a direction opposite to  
15 the curvature in such a way that the pipe is deviated  
from said internal wall.
